Small Licensed Residential Care Facilities Fire Alarm Panel

Code:          2018 Building Code              Date: September 5, 2018
Section: 428.3.7

Question: Does Section 428.3.7 of the Building Code require a commercial fire alarm panel for small licensed residential care facilities?

Answer: No. The system installed must be listed for the use and able to provide all the functions required by the Building Code including but not limited to smoke detection, heat detection, manual pull stations, sprinkler water flow, sprinkler supervisory and occupant notification. Household Alarm Systems listed to UL 985 6th edition are listed for these functions.

UL 985 6th edition is the first edition of the standard to test for sprinkler water flow and sprinkler supervisory, sections 41.1.16 and 41.1.17, respectively. Household Alarm Systems listed to earlier editions of UL 985 may provide those functions, but are not tested by UL. If such a system is capable of providing sprinkler water flow and sprinkler supervisory and is not UL tested for the functions, it is acceptable to approve the panel as an “alternate method” provided the permit holder or his designee is able to demonstrate to the satisfaction of the local Fire Official that the panel provides those functions.
