This series of quick drills will break down the 13 point COAL WAS WEALTH acronym.

Auxiliary appliances are extremely important if the building has them. These include but are not limited to:
- Sprinkler Systems
- Standpipe Systems
- Wet or Dry Chemical Systems

Within the size-up process and if a system is available, it is essential for individuals to determine the following:
- What is the operating status of the system?
- Is it working automatically?
- If not, can it be operated manually?
- Are there fire department connections?

Points to review:

1. Using the same two high hazard structures that you used for the water supply quick drill, determine if there are any auxiliary appliances.
   - Does everyone on the crew know and understand how the system works?
   - Is there more than one type of system within the structure?
   - Will the system require a dedicated engine?
